

Support Macro Library - Product Issue Intake

FIT INTAKE

For footwear fit contacts, ask for usual size, purchased size, foot width if volunteered, activity type, distance used, sock type, and where pressure occurs.

WARRANTY INTAKE

For cracked, broken, or separated components, ask for photos, purchase date, number of uses, playing surface or activity environment, and whether the product was used as intended.

APPAREL QUALITY INTAKE

For color fade, seam twist, pilling, or fabric defects, ask for wash method, care-label adherence, photos, and number of affected items.

tone Standards

Acknowledge the customer impact first. Avoid blaming the customer for size or use conditions. Explain the next evidence needed and expected resolution path.

ROUTING

Route fit guidance to support operations, repeated product copy issues to content operations, warranty clusters to QA, and stock-constrained exchanges to inventory operations.

FIELD EXAMPLES

For Support Macro Library - Product Issue Intake, field teams should separate isolated preference language from repeated issue evidence. Example A: a verified customer reports the issue after one or two normal uses, provides order context, and uses language that matches other recent contacts. Treat this as meaningful early evidence. Example B: a customer reports preference language without operational detail. Treat this as low-confidence but useful for trend monitoring. Example C: several customers in the same market report the same product id and issue phrase within three days. Treat this as a pattern requiring owner review.

REQUIRED INTAKE FIELDS

Required fields for Support Macro Library - Product Issue Intake workflows are product id, order id when available, market, channel, customer segment, issue phrase, product condition, preferred outcome, and evidence attachments when relevant. Footwear also needs activity type, distance or match count, surface, sock or lace context, and usual size. Apparel also needs wash method, care-label status, and photo evidence. Accessories and equipment need number of uses and environment.

DECISION MATRIX

The decision matrix for Support Macro Library - Product Issue Intake prioritizes commercial recovery and accurate customer outcome. Use exchange when the product likely fits the customer after size or fit adjustment and inventory can support the exchange. Use refund when replacement is not practical, the customer no longer wants the product, or policy conditions require refund. Use warranty review when there is possible material or component failure under approved use. Use content update when repeated evidence suggests the product page did not set accurate expectations.

OWNER ROUTING

Owner routing for Support Macro Library - Product Issue Intake depends on the issue class and customer impact. Support operations owns customer handling and macro updates. Product content owns product-page language. Category management owns commercial impact and promotion decisions. Product QA owns physical product investigation. Inventory operations owns stock recovery, warehouse allocation, and exchange feasibility. Marketplace operations owns partner listing alignment.

MEASUREMENT WINDOW

After an action related to Support Macro Library - Product Issue Intake is taken, monitor seven-day movement in ticket count, return count, exchange rate, refund rate, average rating, negative sentiment share, and inventory availability. If contacts decline but return rate remains high, the issue may be deeper than content clarity. If exchange rate improves, the intervention may be preserving demand while reducing refund impact.

MARKET VARIATION

Market review for Support Macro Library - Product Issue Intake should compare language and outcome by US, IN, UK, DE, FR, JP, and AU. A sizing issue concentrated in one market may

reflect local size conversion or marketplace copy. A warranty issue appearing across markets is more likely a product or usage-pattern concern. Channel splits matter because partner listings may omit fit or care guidance that is present on owned digital channels.

COMMERCIAL IMPACT READOUT

The commercial readout for Support Macro Library - Product Issue Intake should combine units sold, order count, refund amount, exchange count, current stock position, and negative sentiment share. High order volume with moderate complaint rate can still represent a large service workload. Low order volume with severe complaints may require quality review because early adopters often influence launch reputation.

SUPPORT MANAGER REVIEW

Support managers reviewing Support Macro Library - Product Issue Intake should check whether agents are collecting enough context before choosing outcome. Missing surface details, missing wash details, or missing fit history can make a valid customer issue look ambiguous. Managers should coach agents to document the customer language exactly because repeated phrasing is often the fastest path to root-cause detection.

PRODUCT TEAM REVIEW

Product teams reviewing Support Macro Library - Product Issue Intake should compare intended design against customer expectation. If the product behaves as designed but customers are surprised, content guidance may be the fix. If the product fails under intended use, QA review is needed. If customers buy the product for an unintended use case, category and content teams should decide whether to redirect demand or change messaging.

OPERATIONAL SCENARIO

Scenario for Support Macro Library - Product Issue Intake: a spike appears on day three, with rising ticket count, repeated issue phrases, and a return rate moving faster than order growth. The first response is not a broad recall or blanket refund. The first response is evidence consolidation, owner routing, inventory check, and a narrowly scoped customer-handling recommendation.

FIELD EXAMPLES

For Support Macro Library - Product Issue Intake, field teams should separate isolated

preference language from repeated issue evidence.
