

EXECUTIVE VIEW

The strongest launch-week signals are sizing pressure on RUN-ULTRA-01, stud durability and heel comfort on SOC-CLEAT-04, and colorfastness complaints on TRN-HOOD-03.

RUNNING SHOES

RUN-ULTRA-01 receives positive performance language around rocker, speed, and grip, but negative feedback clusters around narrow forefoot fit and half-size exchange requests.

FOOTBALL BOOTS

SOC-CLEAT-04 receives positive traction and touch feedback, while negative contacts mention front stud cracks, heel collar rubbing, and surface eligibility questions.

APPAREL

TRN-HOOD-03 negative contacts are mostly about dark color fade after cold wash. Positive comments still mention fleece comfort and team-order fit consistency.

ACTIONS

Recommended actions are size copy update for RUN-ULTRA-01, QA evidence collection for SOC-CLEAT-04, and colorway-level review for TRN-HOOD-03.

FIELD EXAMPLES

For Voice of Customer Launch Digest - Week 33, field teams should separate isolated preference language from repeated issue evidence. Example A: a verified customer reports the issue after one or two normal uses, provides order context, and uses language that matches other recent contacts. Treat this as meaningful early evidence. Example B: a customer reports preference language without operational detail. Treat this as low-confidence but useful for trend monitoring. Example C: several customers in the same market report the same product id and issue phrase within three days. Treat this as a pattern requiring owner review.

REQUIRED INTAKE FIELDS

Required fields for Voice of Customer Launch Digest - Week 33 workflows are product id,
Page 1 of 10

order id when available, market, channel, customer segment, issue phrase, product condition, preferred outcome, and evidence attachments when relevant. Footwear also needs activity type, distance or match count, surface, sock or lace context, and usual size. Apparel also needs wash method, care-label status, and photo evidence. Accessories and equipment need number of uses and environment.

DECISION MATRIX

The decision matrix for Voice of Customer Launch Digest - Week 33 prioritizes commercial recovery and accurate customer outcome. Use exchange when the product likely fits the customer after size or fit adjustment and inventory can support the exchange. Use refund when replacement is not practical, the customer no longer wants the product, or policy conditions require refund. Use warranty review when there is possible material or component failure under approved use. Use content update when repeated evidence suggests the product page did not set accurate expectations.

OWNER ROUTING

Owner routing for Voice of Customer Launch Digest - Week 33 depends on the issue class and customer impact. Support operations owns customer handling and macro updates. Product content owns product-page language. Category management owns commercial impact and promotion decisions. Product QA owns physical product investigation. Inventory operations owns stock recovery, warehouse allocation, and exchange feasibility. Marketplace operations owns partner listing alignment.

MEASUREMENT WINDOW

After an action related to Voice of Customer Launch Digest - Week 33 is taken, monitor seven-day movement in ticket count, return count, exchange rate, refund rate, average rating, negative sentiment share, and inventory availability. If contacts decline but return rate remains high, the issue may be deeper than content clarity. If exchange rate improves, the intervention may be preserving demand while reducing refund impact.

MARKET VARIATION

Market review for Voice of Customer Launch Digest - Week 33 should compare language and outcome by US, IN, UK, DE, FR, JP, and AU. A sizing issue concentrated in one market may reflect local size conversion or marketplace copy. A warranty issue appearing across markets

is more likely a product or usage-pattern concern. Channel splits matter because partner listings may omit fit or care guidance that is present on owned digital channels.

COMMERCIAL IMPACT READOUT

The commercial readout for Voice of Customer Launch Digest - Week 33 should combine units sold, order count, refund amount, exchange count, current stock position, and negative sentiment share. High order volume with moderate complaint rate can still represent a large service workload. Low order volume with severe complaints may require quality review because early adopters often influence launch reputation.

SUPPORT MANAGER REVIEW

Support managers reviewing Voice of Customer Launch Digest - Week 33 should check whether agents are collecting enough context before choosing outcome. Missing surface details, missing wash details, or missing fit history can make a valid customer issue look ambiguous. Managers should coach agents to document the customer language exactly because repeated phrasing is often the fastest path to root-cause detection.

PRODUCT TEAM REVIEW

Product teams reviewing Voice of Customer Launch Digest - Week 33 should compare intended design against customer expectation. If the product behaves as designed but customers are surprised, content guidance may be the fix. If the product fails under intended use, QA review is needed. If customers buy the product for an unintended use case, category and content teams should decide whether to redirect demand or change messaging.

OPERATIONAL SCENARIO

Scenario for Voice of Customer Launch Digest - Week 33: a spike appears on day three, with rising ticket count, repeated issue phrases, and a return rate moving faster than order growth. The first response is not a broad recall or blanket refund. The first response is evidence consolidation, owner routing, inventory check, and a narrowly scoped customer-handling recommendation.

FIELD EXAMPLES

For Voice of Customer Launch Digest - Week 33, field teams should separate isolated preference language from repeated issue evidence. Example A: a verified customer reports the

issue after one or two normal uses, provides order context, and uses language that matches other recent contacts. Treat this as meaningful early evidence.
